The Digital Resolve Platform: Behavioral Monitoring and Analytics

Identify Potential Cyber Threats Before They Happen

Traditional standalone forms of security are no longer enough to thwart today's relentless and sophisticated cyberattacks. It's time to move digital profiling to the frontline—from a "nice-to-have" to "must-have" security tool—to proactively prevent data breaches and the accompanying fraud that often results. True protection comes in the form of solutions that can help security professionals proactively recognize potential threats—before they happen.

Digital Resolve's Behavioral Monitoring and Analytics solution provides organizations of any size with new-found proactive protection and insight into suspicious behaviors that serve as warnings of potential cyber threats, helping save time, resources, costs and reputations.

Our solution monitors every user interaction and transaction to uncover any suspect behaviors while users are engaged with your site and corporate networks. Then, behavioral analysis takes security to another level by examining activities and behaviors so that even if someone can compromise a user's identity, the hacker still must be able to act like the user, which is when the alarms start to sound.

Digital Resolve's comprehensive digital behavioral profiling involves tracking users and accounts in multiple ways to determine regular user patterns and flag suspicious activity across a company's entire business channel. By determining regular user patterns at multiple levels, suspect activity can be flagged and handled accordingly in real time.

Key monitoring features include:

User and channel analysis

Application navigation analysis

Online session and transaction profiling

Account and personal information monitoring

Click analysis

Payment profiling

Device fingerprint analysis

Accurately predict, profile and flag suspicious activity.

Behavioral Monitoring and Analytics Benefits

Easy to Implement

Utilizes an easy-to-deploy methodology that minimizes or outright eliminates the need for direct integration to the website or network being monitored.

Multi-Layered

Delivers a proven multi-layer security solution in a cost-effective manner, supported by a highly regarded client services organization.

Proven

Offers a proven ability to apply a deep level of granular real-time analyses for high-risk transactions (e.g., payments.)

Non-Invasive

Incorporates non-invasive technology that does not negatively impact the user experience in terms of access, interactions and transactions.

"We have been using the platform for over five years. The application is easy to use and easy to customize so we have added it to all our online products. The real-time alerts give our fraud team a means to address the situation quickly to prevent losses."

EVP – Online Fraud Operations - Large Financial Banking Company
